

POSITION WITH REGARD TO VOLATILE ORGANIC COMPOUNDS (VOC's)

The adhesives used by UPM Raflatac in the manufacture of self-adhesive laminates are either water based or hotmelts, no solvent adhesives are used.

There are some residual monomers present in the wet adhesive. During the manufacture of the laminate the adhesive is dried. In the drying process these residual monomers are driven off in the ovens and classed as VOC (volatile organic compound) emissions. These are at low levels and within European and local regulations.

It is theoretically possible that trace amounts of these VOC's may still be present in the dried laminate. These would be at extremely low levels and therefore difficult to measure
